

Python is installed on CAEN computers! If there are any issues with installing Python or running code on your personal computer, we highly recommend using a CAEN computer instead, since this will be a clean and controlled installation of Python 3.

Setup Step	
Mac Instruction or Command	Windows Instruction or Command
Common Instruction or Command (regardless of OS)	
Open Terminal Window	
Open Terminal (Navigate to Finder > Applications > Utilities > Terminal)	Open Command Prompt (Press the Windows key to search, and search for the Command Prompt)
Recall Useful Terminal Commands	
Mac terminal uses standard Linux terminal commands. Use 'ls' to look at the files in your current working directory. Use 'python3' to run Python commands.	Windows Command Prompt uses different terminal commands. Use 'dir' instead of 'ls' to look at the files in your current working directory. Use 'py' instead of 'python' to run Python commands.
Create Virtual Environment (following this tutorial, linked in HW2)	
Creating a virtual environment creates a folder of the given name with special scripts for activating and deactivating the environment. Once the environment is created, please copy the given starter code into the virtual environment folder. For example, if you are in 'Documents', create a virtual environment called eecs492_hw, and copy in the starter code for Homework 2, the path to the code will be: 'Documents/eecs492_hw/HW2Coding'.	
<pre>python3 -m venv <venv-name></pre> For example: <pre>python3 -m venv eecs492_hw</pre>	<pre>py -m venv <venv-name></pre> For example: <pre>py -m venv eecs492_hw</pre>

Activate the Virtual Environment (following this tutorial, linked in HW2)	
<pre>source <venv-name>/bin/activate</pre> For example: <pre>source eecs492_hw/bin/activate</pre>	<pre><venv-name>\Scripts\activate</pre> For example: <pre>eecs492_hw\Scripts\activate</pre>
Install Starter Code Requirements into the Virtual Environment This will use the requirements.txt file released with the homework starter code. Navigate to the folder with the starter code to make sure this command has access to requirements.txt.	
<pre>python3 -m pip install -r requirements.txt</pre>	<pre>py -m pip install -r requirements.txt</pre>
Run Homework Code Tests	
<pre>python3 Game.py TTT python3 Game.py C4 python3 Game.py C4 test0.txt</pre>	<pre>py Game.py TTT py Game.py C4 py Game.py C4 test0.txt</pre>
Deactivate Virtual Environment (following this tutorial, linked in HW2)	
<pre>deactivate</pre>
